

Final Project Writeup and Presentation

ARC dataset option:

Please write 1500-2000 words for the Related Work, Methods, and Results sections of a paper describing your model.

These sections should include the following:

Related Work

- Characterize the ARC benchmark itself and its significance, and cite the published accuracy numbers so that your result has an external reference point.
- Organize prior approaches by idea (e.g., BERT-related approaches, retrieval-augmented, visual approaches) and synthesize what each family got right or wrong (rather than a list of sentences stating "Paper A did X, Paper B did Y")
- Explain the specific gap or design choice your method builds on

Methods

- Explain your data and how the model handles it: how multiple-choice is cast as a learning problem (e.g., scoring each option), input representation, preprocessing, and exact train/val/test splits. This should be specific enough that someone reading your report could reproduce it.
- Specify the architecture(s), key hyperparameters, and training procedure. Explain your reasoning for each nontrivial choice you made.
- State your experimental design: baselines, ablations, what's held fixed, the evaluation metric, and how you tested each component.

Results

- Report how your model compares to prior literature with similar approaches
- Report on the types of errors your model makes—which question types fail, and whether this is similar or different to findings in previous literature
- Include at least one plot illustrating a core finding in your report.
- Include at least one table illustrating core metrics in your report.

For the presentation, you will have 3-5 minutes to present a lightning talk to your peers highlighting the portions of your model and findings that you would like to share.

Communication option:

Please write a 1500-2000 word experience report describing your artifact.

Examples of experience reports and tools papers that introduce a tool/artifact:

LLMs Unplugged: <https://dl.acm.org/doi/epdf/10.1145/2445196.2445368>

Python Tutor: <https://dl.acm.org/doi/epdf/10.1145/3786228.3786237>

The sections you decide on are flexible—what best showcases your artifact and the choices you made in designing it? Make sure that all of the categories specified on the SIGCSE webpage are taken into account:

- Motivation
- Prior and Related Work
- Approach
- Evidence
- Contribution & Impact
- Presentation

Check specifically for the requirements in the “Experience Reports & Tools (ERT)” column:

<https://sigcse2026.sigcse.org/track/sigcse-ts-2026-Papers#Choosing-a-Track>. For parts such as “Evidence” that would require feedback from people using your tool, write about what evidence you’d like to collect and what positive or negative feedback you would expect from people using your artifact depending on if the design choices you made worked (or didn’t) in the way that you intended for them to.

For the presentation, you will have a 10-15 minute slot to give a presentation to your peers, highlighting the portions of your artifact and design process that you would like to share.
